

TB Information Summary

Project: Geomatrix

Date: 2026-09-20

This file contains the key technical brief and status information for the TB/m

1. Model integrity policy

- Use only real labeled data.
- Reject synthetic or test-class records.
- Require a valid two-class dataset before training.
- Do not fabricate delay-day predictions without a verified regression target.

2. Current status

- Prediction output is only trusted when a real trained model is available.
- When no valid model exists, the app must display:
Model not trained - insufficient real labeled data.
- Confidence must remain within the valid range 0.0 to 1.0.

3. Verification

- Project root pytest checks were run successfully.
- The app is configured to stay honest under uncertainty instead of inventing

4. Notes

- Gemini is an explanation/recommendation layer only.
- UI/UX was preserved without redesign.
- No hardcoded or fake predictions were introduced.
